Contraction theory: historical notes

- **Origins**

S. Banach. Sur les opérations dans les ensembles abstraits et leur application aux équations intégrales. *Fundamenta Mathematicae*, 3(1):133–181, 1922. doi:

- **Dynamics:**

G. Dahlquist. *Stability and error bounds in the numerical integration of ordinary differential equations*. PhD thesis, (Reprinted in Trans. Royal Inst. of Technology, No. 130, Stockholm, Sweden, 1959), 1958

S. M. Lozinskii. Error estimate for numerical integration of ordinary differential equations. I. *Izvestiya Vysshikh Uchebnykh Zavedenii. Matematika*, 5:52–90, 1958. URL <http://mi.mathnet.ru/eng/ivm2980>. (in Russian)

- **Computation:**

C. A. Desoer and H. Haneda. The measure of a matrix as a tool to analyze computer algorithms for circuit analysis. *IEEE Transactions on Circuit Theory*, 19(5):480–486, 1972. doi:

- **Systems and control:**

W. Lohmiller and J.-J. E. Slotine. On contraction analysis for non-linear systems. *Automatica*, 34(6):683–696, 1998. doi:

Linear algebra: induced norms

Vector norm

$$\|x\|_1 = \sum_{i=1}^n |x_i|$$

$$\|x\|_2 = \sqrt{\sum_{i=1}^n x_i^2}$$

$$\|x\|_\infty = \max_{i \in \{1, \dots, n\}} |x_i|$$

Induced matrix norm

$$\|A\|_1 = \max_{j \in \{1, \dots, n\}} \sum_{i=1}^n |a_{ij}|$$

$$\|A\|_2 = \sqrt{\lambda_{\max}(A^\top A)}$$

$$\|A\|_\infty = \max_{i \in \{1, \dots, n\}} \sum_{j=1}^n |a_{ij}|$$

Induced matrix log norm

$$\begin{aligned}\mu_1(A) &= \max_{j \in \{1, \dots, n\}} \left(a_{jj} + \sum_{i=1, i \neq j}^n |a_{ij}| \right) \\ &= \text{max column "absolute sum" of } A\end{aligned}$$

$$\mu_2(A) = \lambda_{\max}\left(\frac{A + A^\top}{2}\right)$$

$$\begin{aligned}\mu_\infty(A) &= \max_{i \in \{1, \dots, n\}} \left(a_{ii} + \sum_{j=1, j \neq i}^n |a_{ij}| \right) \\ &= \text{max row "absolute sum" of } A\end{aligned}$$

$$x_{k+1} = \mathsf{F}(x_k) \quad \text{on } \mathbb{R}^n \text{ with norm } \|\cdot\| \text{ and induced norm } \|\cdot\|$$

Lipschitz constant

$$\begin{aligned}\text{Lip}(\mathsf{F}) &= \inf\{\ell > 0 \text{ such that } \|\mathsf{F}(x) - \mathsf{F}(y)\| \leq \ell \|x - y\| \text{ for all } x, y\} \\ &= \sup_x \|\mathsf{J}_{\mathsf{F}}(x)\|\end{aligned}$$

For **scalar map** f , $\text{Lip}(f) = \sup_x |f'(x)|$

For **affine map** $\mathsf{F}_A(x) = Ax + a$

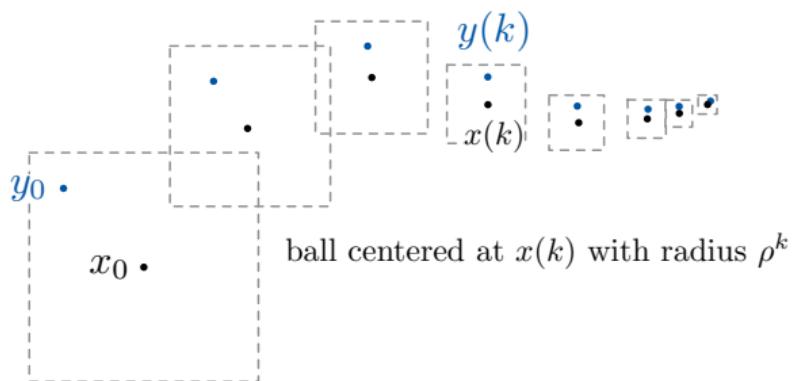

$$\|x\|_{2,P} = (x^\top Px)^{1/2} \quad \text{Lip}_{2,P}(\mathsf{F}_A) = \|A\|_{2,P} \leq \ell \iff A^\top PA \preceq \ell^2 P$$

$$\|x\|_{\infty,\eta} = \max_i |x_i|/\eta_i \quad \text{Lip}_{\infty,\eta}(\mathsf{F}_A) = \|A\|_{\infty,\eta} \leq \ell \iff \eta^\top |A| \leq \ell \eta^\top$$

Banach contraction theorem for discrete-time dynamics:

If $\rho := \text{Lip}(F) < 1$, then

- ① F is **contracting** = distance between trajectories decreases exp fast (ρ^k)
- ② F has a unique, glob exp stable equilibrium x^*

From discrete to continuous time

The **induced log norm** of $A \in \mathbb{R}^{n \times n}$ wrt to $\|\cdot\|$:

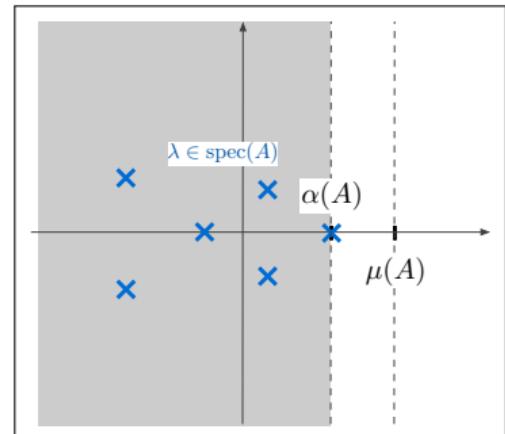

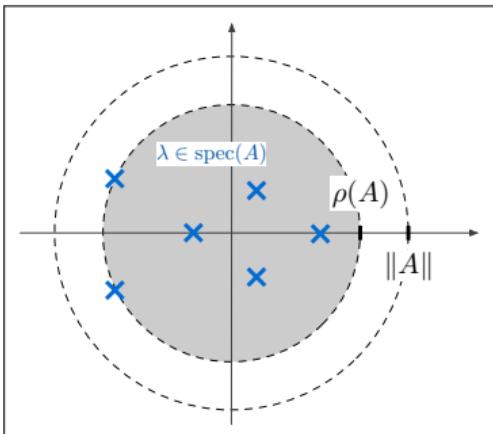

$$\mu(A) := \lim_{h \rightarrow 0^+} \frac{\|I_n + hA\| - 1}{h}$$

subadditivity:

$$\mu(A + B) \leq \mu(A) + \mu(B)$$

scaling:

$$\mu(bA) = b\mu(A), \quad \forall b \geq 0$$

Example induced log norms

Vector norm	Induced matrix norm	Induced matrix log norm
$\ x\ _1 = \sum_{i=1}^n x_i $	$\ A\ _1 = \max_{j \in \{1, \dots, n\}} \sum_{i=1}^n a_{ij} $	$\mu_1(A) = \max_{j \in \{1, \dots, n\}} \left(a_{jj} + \sum_{i=1, i \neq j}^n a_{ij} \right)$ = max column "absolute sum" of A
$\ x\ _2 = \sqrt{\sum_{i=1}^n x_i^2}$	$\ A\ _2 = \sqrt{\lambda_{\max}(A^\top A)}$	$\mu_2(A) = \lambda_{\max}\left(\frac{A + A^\top}{2}\right)$
$\ x\ _\infty = \max_{i \in \{1, \dots, n\}} x_i $	$\ A\ _\infty = \max_{i \in \{1, \dots, n\}} \sum_{j=1}^n a_{ij} $	$\mu_\infty(A) = \max_{i \in \{1, \dots, n\}} \left(a_{ii} + \sum_{j=1, j \neq i}^n a_{ij} \right)$ = max row "absolute sum" of A

Continuous-time dynamics and one-sided Lipschitz constants

$\dot{x} = F(x)$ on \mathbb{R}^n with norm $\|\cdot\|$ and induced log norm $\mu(\cdot)$

One-sided Lipschitz constant

$$\begin{aligned}\text{osLip}(F) &= \inf\{b \in \mathbb{R} \text{ such that } \langle\langle F(x) - F(y), x - y \rangle\rangle \leq b\|x - y\|^2 \text{ for all } x, y\} \\ &= \sup_x \mu(J_F(x))\end{aligned}$$

For **scalar map** f , $\text{osLip}(f) = \sup_x f'(x)$

For **affine map** $F_A(x) = Ax + a$

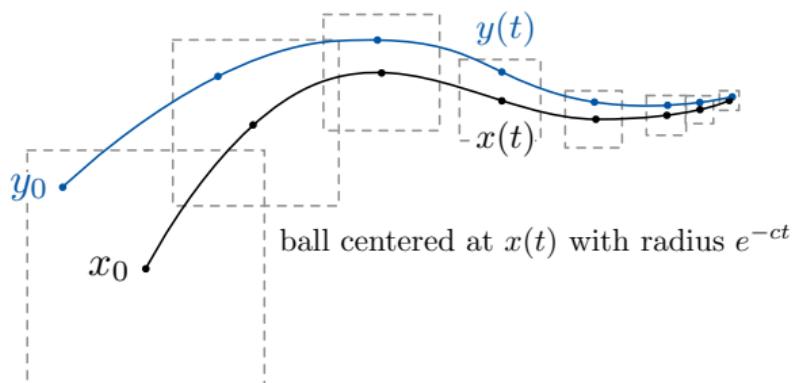

$$\text{osLip}_{2,P}(F_A) = \mu_{2,P}(A) \leq \ell \iff A^\top P + AP \preceq 2\ell P$$

$$\text{osLip}_{\infty,\eta}(F_A) = \mu_{\infty,\eta}(A) \leq \ell \iff a_{ii} + \sum_{j \neq i} |a_{ij}| \eta_i / \eta_j \leq \ell$$

Banach contraction theorem for continuous-time dynamics:

If $-c := \text{osLip}(F) < 0$, then

- ① F is **infinitesimally contracting** = distance between trajectories decreases exp fast (e^{-ct})
- ② F has a unique, glob exp stable equilibrium x^*

Detour: From inner products to weak pairings

$$\frac{1}{2} \frac{d}{dt} \|x(t)\|_2^2 = \dot{x}^\top x = \langle\langle \dot{x}, x \rangle\rangle$$

$$\implies \frac{1}{2} D^+ \|x(t)\|^2 =: [\![\dot{x}, x]\!]$$

- D^+ is upper-right Dini derivative
- **weak pairing** $[\![\cdot, \cdot]\!] : \mathbb{R}^n \times \mathbb{R}^n \rightarrow \mathbb{R}$ exists for each norm, i.e.,

$$[\![y, x]\!]_1 := \|x\|_1 \operatorname{sign}(x)^\top y \quad (\text{sign pairing})$$

$$[\![y, x]\!]_\infty := \max_{i \in \mathcal{A}_\infty(x)} x_i y_i \quad \text{for } \mathcal{A}_\infty(x) = \{i \mid |x_i| = \|x\|_\infty\} \quad (\text{max pairing})$$

theory of weak pairings: computational properties
and applications to monotone operators

**Log norm
bounds****Demidovich
conditions****One-sided Lipschitz
conditions**

$$\mu_{2,P}(\mathbf{J}_F(x)) \leq -c \quad P\mathbf{J}_F(x) + \mathbf{J}_F(x)^\top P \preceq -2cP \quad (x-y)^\top P(F(x) - F(y)) \leq -c\|x-y\|_{P^{1/2}}^2$$

$$\mu_1(\mathbf{J}_F(x)) \leq -c \quad \text{sign}(v)^\top \mathbf{J}_F(x)v \leq -c\|v\|_1 \quad \text{sign}(x-y)^\top (F(x) - F(y)) \leq -c\|x-y\|_1$$

$$\mu_\infty(\mathbf{J}_F(x)) \leq -c \quad \max_{i \in \mathcal{A}_\infty(v)} v_i (\mathbf{J}_F(x)v)_i \leq -c\|v\|_\infty^2 \quad \max_{i \in \mathcal{A}_\infty(x-y)} (x_i - y_i)(F_i(x) - F_i(y)) \leq -c\|x-y\|_\infty^2$$

Each row = three equivalent statements.

To be understood for all $x, y \in \mathbb{R}^n$ and all $v \in \mathbb{R}^n$.

Example #1: Gradient flow for strongly convex function

Given strongly convex $f : \mathbb{R}^n \rightarrow \mathbb{R}$ with parameter μ , **gradient dynamics**

$$\dot{x} = f_G(x) := -\nabla f(x)$$

f_G is infinitesimally contracting wrt $\|\cdot\|_2$ with rate μ

If f is twice-differentiable, then $\text{Hess } f(x) \succeq \mu I_n$ for all x

$$\begin{aligned}\mathsf{J}_{(-\nabla f)}(x) &= -\text{Hess } f(x) \preceq -\mu I_n \\ \iff I_n \mathsf{J}_{(-\nabla f)}(x) + \mathsf{J}_{(-\nabla f)}(x)^\top I_n &\preceq -2\mu I_n\end{aligned}$$

Example #2: Primal-dual gradient dynamics

strongly convex function f

$$\text{s.t. } 0 \prec \mu_{\min} I_n \preceq \text{Hess } f \preceq \mu_{\max} I_n$$

constraint matrix A

$$\text{s.t. } 0 \prec a_{\min} I_m \preceq AA^\top \preceq a_{\max} I_m$$

$$\begin{aligned} & \min_{x \in \mathbb{R}^n} f(x) \\ & \text{s.t. } Ax = b \end{aligned}$$

primal-dual gradient dynamics:

$$\begin{bmatrix} \dot{x} \\ \dot{\lambda} \end{bmatrix} = f_{\text{PDG}}(x, \lambda) := \begin{bmatrix} -\nabla f(x) - A^\top \lambda \\ Ax - b \end{bmatrix}$$

f_{PDG} is infinitesimally contracting wrt weighted $\|\cdot\|_{2,P^{1/2}}$ with rate c

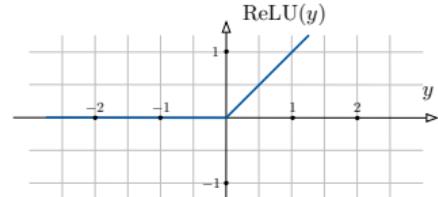

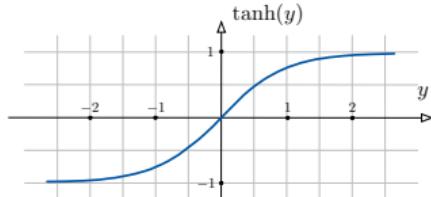

$$P = \begin{bmatrix} I_n & \alpha A^\top \\ \alpha A & I_m \end{bmatrix}, \quad \alpha = \frac{1}{3} \min \left\{ \frac{1}{\mu_{\max}}, \frac{\mu_{\min}}{a_{\max}} \right\}, \quad \text{and} \quad c = \frac{5}{18} \min \left\{ \frac{a_{\min}}{\mu_{\max}}, \frac{a_{\min}}{a_{\max}} \mu_{\min} \right\}$$

$$\text{For each } \mu_{\min} I_n \preceq Q \preceq \mu_{\max} I_n, \quad \begin{bmatrix} -Q & -A^\top \\ A & 0 \end{bmatrix}^\top P + P \begin{bmatrix} -Q & -A^\top \\ A & 0 \end{bmatrix} \preceq -2cP$$

Example #3: Firing-rate recurrent neural network

$$\dot{x} = f_{\text{FR}}(x) := -x + \Phi(Ax + Bu)$$

sigmoid, hyperbolic tangent
 $\text{ReLU} = \max\{x, 0\} = (x)_+$
 $0 \leq \Phi'_i(y) \leq 1$

f_{FR} is infinitesimally contracting wrt $\|\cdot\|_\infty$ with rate $1 - \mu_\infty(A)_+$ if

$$\mu_\infty(A) < 1 \quad (\text{i.e., } a_{ii} + \sum_j |a_{ij}| < 1 \text{ for all } i)$$

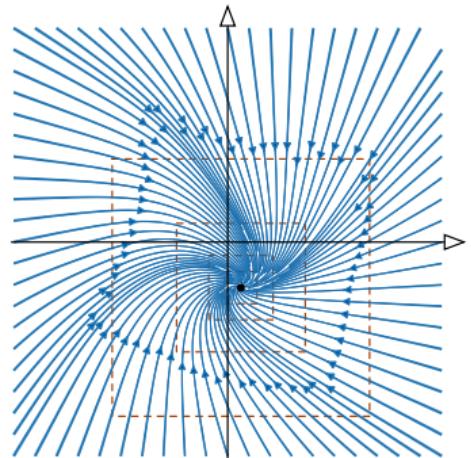

$$\begin{aligned} \text{osLip}_\infty(f_{\text{FR}}) &= \sup_{x,u} \mu_\infty(-I_n + (\mathbb{J}_\Phi(Ax + Bu))A) = -1 + \sup_{x,u} \mu_\infty(\mathbb{J}_\Phi(Ax + Bu)A) \\ &= -1 + \max_{d \in [0,1]^n} \mu_\infty(\text{diag}(d)A) \quad (\text{max convex polytope, } 2^n \text{ vertices}) \\ &= -1 + \max \{\mu_\infty(0), \mu_\infty(A)\} = -1 + \mu_\infty(A)_+ \end{aligned}$$

contractivity = robust computationally-friendly stability

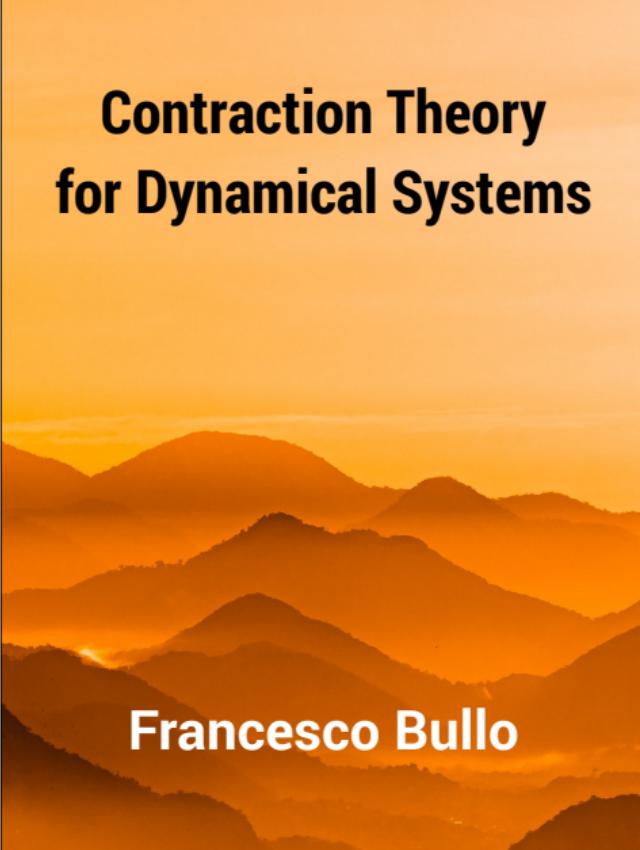

fixed point theory + Lyapunov stability theory + geometry of metric spaces

highly-ordered transient and asymptotic behavior:

- ① unique globally exponential stable equilibrium
& two natural Lyapunov functions
- ② robustness properties
 - bounded input, bounded output (iss)
 - finite input-state gain
 - robustness margin wrt unmodeled dynamics
 - robustness margin wrt delayed dynamics
- ③ periodic input, periodic output
- ④ modularity and interconnection properties
- ⑤ accurate numerical integration and equilibrium point computation

- 5 Conclusions and future research

While most ML architectures are feedforward,
biological neural networks are recurrent and resemble implicit ML architectures

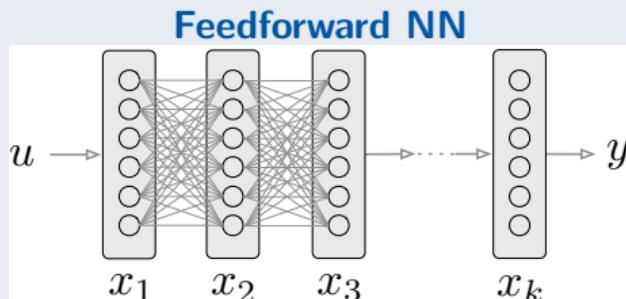

artificial neural network AlexNet '12

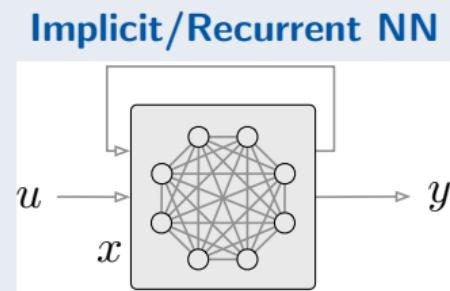

C. elegans connectome '17

Aim: understand the dynamics of neural networks, so that

- **reproducible behavior, i.e., equilibrium response as function of stimulus**
- robust behavior in face of uncertain stimuli and dynamics
- learning models, efficient computational tools, periodic behaviors ...

$$x_{i+1} = \Phi(A_i x_i + b_i), \quad x_0 = u,$$
$$y = C x_k + d$$

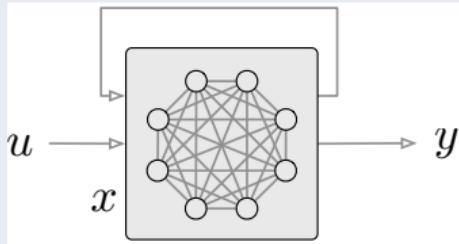

$$x = \Phi(Ax + Bu + b),$$
$$y = Cx + d$$

Fixed point strategies in data science = simplifying and unifying framework to model, analyze, and solve advanced convex optimization methods, Nash equilibria, monotone inclusions, etc.

P. L. Combettes and J.-C. Pesquet. Fixed point strategies in data science. *IEEE Transactions on Signal Processing*, 2021. doi:

Application: ℓ_∞ -contracting neural networks

$$\dot{x} = -x + \Phi(Ax + Bu + b)$$

(*recurrent NN*)

$$x = \Phi(Ax + Bu + b)$$

(*implicit NN*)

$$x_{k+1} = (1 - \alpha)x_k + \alpha\Phi(Ax_k + Bu + b)$$

(*forward Euler*)

If

$$\mu_\infty(A) < 1 \quad \left(\text{i.e., } a_{ii} + \sum_j |a_{ij}| < 1 \text{ for all } i \right)$$

- recurrent NN is infinitesimally contracting with rate $1 - \mu_\infty(A)_+$
- implicit NN is well posed

- forward Euler is contracting with factor $1 - \frac{1 - \mu_\infty(A)_+}{1 - \min_i(a_{ii})_-}$

$$\text{at } \alpha = \frac{1}{1 - \min_i(a_{ii})_-}$$

Forward Euler theorem

Forward Euler theorem for contracting dynamics

Given arbitrary norm $\|\cdot\|$, equivalent statements

- ① $\dot{x} = F(x)$ is infinitesimally contracting
- ② there exists $\alpha > 0$ such that $x_{k+1} = x_k + \alpha F(x_k)$ is contracting

Given *contraction rate* c and *Lipschitz constant* ℓ , define *condition number* $\kappa = \frac{\ell}{c} \geq 1$

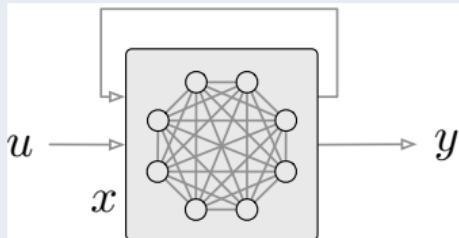

- ① $\text{Id} + \alpha F$ is contracting for

$$0 < \alpha < \frac{1}{c\kappa(1 + \kappa)}$$

- ② the optimal step size minimizing and minimum contraction factor:

$$\begin{aligned}\alpha^* &= \frac{1}{c} \left(\frac{1}{2\kappa^2} - \frac{3}{8\kappa^3} + \mathcal{O}\left(\frac{1}{\kappa^4}\right) \right) \\ \ell^* &= 1 - \frac{1}{4\kappa^2} + \frac{1}{8\kappa^3} + \mathcal{O}\left(\frac{1}{\kappa^4}\right)\end{aligned}$$

Application: ℓ_∞ -contracting neural networks

$$\dot{x} = -x + \Phi(Ax + Bu + b) \quad (\text{recurrent NN})$$
$$x = \Phi(Ax + Bu + b) \quad (\text{implicit NN})$$
$$x_{k+1} = (1 - \alpha)x_k + \alpha\Phi(Ax_k + Bu + b) \quad (\text{forward Euler})$$

If

$$\mu_\infty(A) < 1 \quad \left(\text{i.e., } a_{ii} + \sum_j |a_{ij}| < 1 \text{ for all } i \right)$$

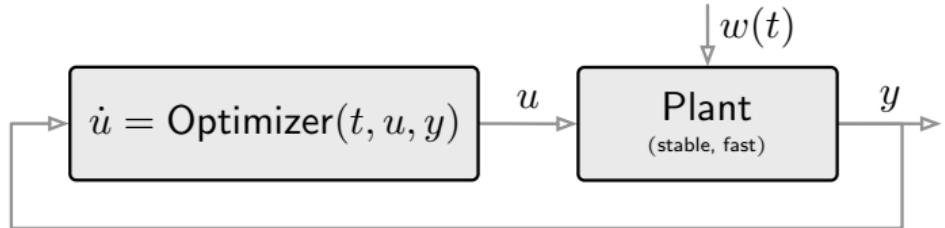

- recurrent NN is contracting with rate $1 - \mu_\infty(A)_+$
- implicit NN is well posed
- forward Euler is contracting with factor $1 - \frac{1 - \mu_\infty(A)_+}{1 - \min_i(a_{ii})_-}$
- input-state Lipschitz constant $\text{Lip}_{u \rightarrow x} = \frac{\|B\|_\infty}{1 - \mu_\infty(A)_+}$

$$\text{at } \alpha^* = \frac{1}{1 - \min_i(a_{ii})_-}$$

Solving optimization problems via dynamical systems

- studies in linear and nonlinear programming (Arrow, Hurwicz, and Uzawa 1958)
- neural networks (Hopfield and Tank 1985) and analog circuits (Kennedy and Chua 1988)
- optimization on manifolds (Brockett 1991)
- ...
- power grids (Bolognani, Carli, Cavraro, Zampieri 2013)
- online and dynamic feedback optimization (Dall'Anese, Dörfler, Simonetto, ...)

Kachurovskii's Theorem: For differentiable $f : \mathbb{R}^n \rightarrow \mathbb{R}$, equivalent statements:

- ① f is **strongly convex** with parameter m
- ② $-\nabla f$ is **(strongly) infinitesimally contracting** with respect to $\|\cdot\|_2$ with rate m

Also: global minimum of f = globally-exponentially stable equilibrium of $-\nabla f$

R. I. Kachurovskii. Monotone operators and convex functionals. *Uspekhi Matematicheskikh Nauk*, 15(4):213–215, 1960

From convex optimization to contracting dynamics – time-varying

Many convex optimization problems can be solved with contracting dynamics

$$\dot{x} = F(x, \theta)$$

	Convex Optimization	Contracting Dynamics
Unconstrained	$\min_{x \in \mathbb{R}^n} f(x, \theta)$	$\dot{x} = -\nabla_x f(x, \theta)$
Constrained	$\min_{\substack{x \in \mathbb{R}^n \\ \text{s.t.} \quad x \in \mathcal{X}(\theta)}} f(x, \theta)$	$\dot{x} = -x + \text{Proj}_{\mathcal{X}(\theta)}(x - \gamma \nabla_x f(x, \theta))$
Composite	$\min_{x \in \mathbb{R}^n} f(x, \theta) + g(x, \theta)$	$\dot{x} = -x + \text{prox}_{\gamma g_\theta}(x - \gamma \nabla_x f(x, \theta))$
Equality	$\min_{\substack{x \in \mathbb{R}^n \\ \text{s.t.} \quad Ax = b(\theta)}} f(x, \theta)$	$\begin{aligned} \dot{x} &= -\nabla_x f(x, \theta) - A^\top \lambda, \\ \dot{\lambda} &= Ax - b(\theta) \end{aligned}$
Inequality	$\min_{\substack{x \in \mathbb{R}^n \\ \text{s.t.} \quad Ax \leq b(\theta)}} f(x, \theta)$	$\begin{aligned} \dot{x} &= -\nabla f(x, \theta) - A^\top \nabla M_{\gamma, b(\theta)}(Ax + \gamma \lambda), \\ \dot{\lambda} &= \gamma(-\lambda + \nabla M_{\gamma, b(\theta)}(Ax + \gamma \lambda)) \end{aligned}$

Tracking equilibrium trajectories

For parameter-dependent vector field $\mathsf{F} : \mathbb{R}^n \times \mathbb{R}^d \rightarrow \mathbb{R}^n$ and differentiable $\theta : \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}^d$

$$\dot{x}(t) = \mathsf{F}(x(t), \theta(t))$$

Assume there exist norms $\|\cdot\|_{\mathcal{X}}$ and $\|\cdot\|_{\Theta}$ s.t.

- **s.c.**: $x \mapsto \mathsf{F}(x, \theta)$ is strongly contracting in $\|\cdot\|_{\mathcal{X}}$ with rate $c > 0$, uniformly in θ
- **Lip**: $\theta \mapsto \mathsf{F}(x, \theta)$ is Lipschitz with constant ℓ_θ , uniformly in x

Theorem: Incremental ISS any two soltns: $x(t)$ with input u_x and $y(t)$ with input u_y

$$D^+ \|x(t) - y(t)\|_{\mathcal{X}} \leq -c \|x(t) - y(t)\|_{\mathcal{X}} + \ell \|u_x(t) - u_y(t)\|_{\Theta}$$

Tracking equilibrium trajectories

For parameter-dependent vector field $\mathbf{F} : \mathbb{R}^n \times \mathbb{R}^d \rightarrow \mathbb{R}^n$ and differentiable $\theta : \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}^d$

$$\dot{x}(t) = \mathbf{F}(x(t), \theta(t))$$

Assume there exist norms $\|\cdot\|_{\mathcal{X}}$ and $\|\cdot\|_{\Theta}$ s.t.

- **s.c.**: $x \mapsto \mathbf{F}(x, \theta)$ is strongly contracting in $\|\cdot\|_{\mathcal{X}}$ with rate $c > 0$, uniformly in θ
- **Lip**: $\theta \mapsto \mathbf{F}(x, \theta)$ is Lipschitz with constant ℓ_θ , uniformly in x

Theorem: Equilibrium tracking for contracting dynamics

- ① for each fixed θ , there exists a unique equilibrium $x^*(\theta)$
- ② the equilibrium map $x^*(\cdot)$ is Lipschitz with constant $\frac{\ell_\theta}{c}$
- ③
$$\frac{d}{dt} \|x(t) - x^*(\theta(t))\|_{\mathcal{X}} \leq -c \|x(t) - x^*(\theta(t))\|_{\mathcal{X}} + \frac{\ell_\theta}{c} \|\dot{\theta}(t)\|_{\Theta}$$

Consequences for tracking error

$$\frac{d}{dt} \|x(t) - x^*(\theta(t))\|_{\mathcal{X}} \leq -c \|x(t) - x^*(\theta(t))\|_{\mathcal{X}} + \frac{\ell_\theta}{c} \|\dot{\theta}(t)\|_{\Theta}$$

- bounded input, bounded error
with asymptotic bound:

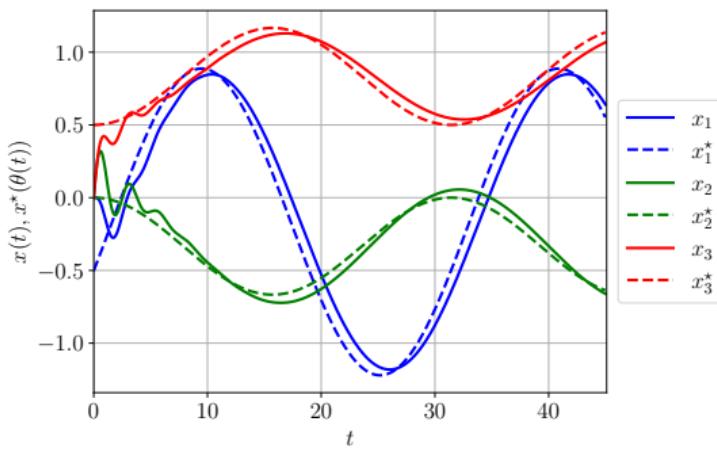

$$\limsup_{t \rightarrow \infty} \|x(t) - x^*(\theta(t))\|_{\mathcal{X}} \leq \frac{\ell_\theta}{c^2} \limsup_{t \rightarrow \infty} \|\dot{\theta}(t)\|_{\Theta}$$

- bounded energy input, bounded energy error
- vanishing input, vanishing error
- exponentially vanishing input, exponentially vanishing error
- periodic input, periodic error

Numerical simulations

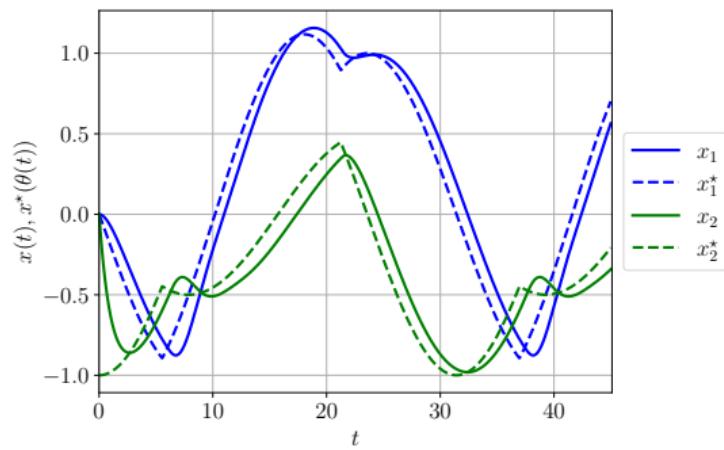

$$\begin{aligned} \min_{x \in \mathbb{R}^3} \quad & \frac{1}{2} \|x - r(t)\|_2^2 \\ \text{s.t.} \quad & x_1 + 2x_2 + x_3 = \sin(\omega t), \end{aligned}$$

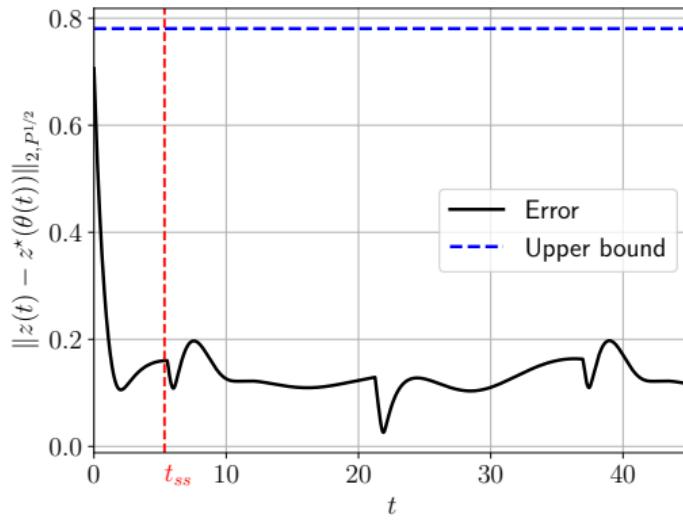

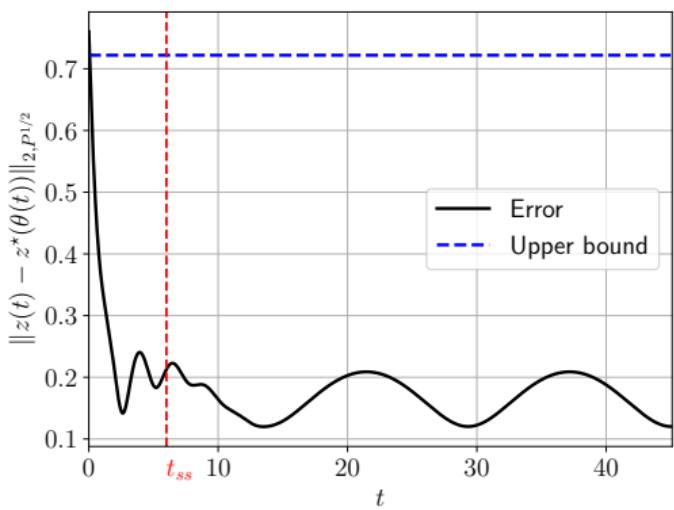

$$r(t) = (\sin(\omega t), \cos(\omega t), 1), \omega = 0.2$$

$$\begin{aligned} \min_{x \in \mathbb{R}^2} \quad & \frac{1}{2} \|x + r(t)\|_2^2 \\ \text{s.t.} \quad & -x_1 + x_2 \leq \cos(\omega t), \end{aligned}$$

$$r(t) = (\sin(\omega t), \cos(\omega t)), \omega = 0.2$$

Summary:

- ① from convex optimization to contracting dynamics
- ② tracking-bounds for time-varying contracting systems
- ③ applications to standard convex optimization problems

Ongoing work and open problems:

- ① contracting predictor-corrector methods
- ② tracking bounds in time-varying norms
- ③ convex but not strongly convex problems

Outline

- 1 A story in three chapters
- 2 Contractivity of dynamical systems
 - Key definitions
 - Table of infinitesimal contractivity conditions
 - Examples
 - Properties
- 3 Application to recurrent neural networks
 - Recurrent and implicit networks
 - Forward Euler theorem
- 4 Application to time-varying convex optimization via contracting dynamics

- 5 Conclusions and future research

Robust and computationally-friendly stability theory

- ① contractivity conditions on normed vector spaces
- ② application: disturbances and interconnections
- ③ application to recurrent and implicit neural networks
- ④ application to time-varying convex optimization

	Lyapunov Theory	Contraction Theory for Dynamical Systems
existence of equilibrium	F admits global Lyapunov function assumed	F is strongly contracting implied + computational methods
Lyapunov function inputs	arbitrary	distance to trajectory (+ norm of vector field)
	ISS via \mathcal{KL} and \mathcal{L} functions	iISS via explicit formulas

search for contraction properties
design engineering systems to be contracting

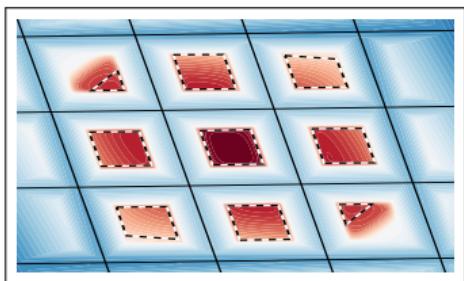

Theoretical frontiers

- higher order contraction
- relationship with monotone operator theory
- metric spaces: seminorms, Hilbert metrics ...

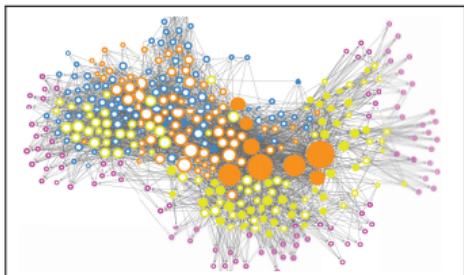

Limitations: not all stable systems are contractive:

- Lyapunov-diagonally-stable networks
- multistable systems
- biochemical networks

Application to control and learning

- ① control: optimization-based control design
- ② ML: implicit models and energy-based learning
- ③ neuroscience: robust dynamical modeling
